1. INTRODUCTION

We define the sequence $\sigma_{n,k}(z)$ recursively by

$$\sigma_{n,0}(z) = \sum_{j=0}^n z^j, \quad \sigma_{n,k}(z) = \sum_{j=0}^n \sigma_{j,k-1}(z) \quad (k \in \mathbf{N}).$$

Then we have

$$\sigma_{n,k}(e^{ix}) = \sum_{j=0}^n \binom{n+k-j}{k} \cos(jx) + i \sum_{j=1}^n \binom{n+k-j}{k} \sin(jx).$$

In 1935, Turán [12] studied the imaginary part and proved by induction on n and k the remarkable inequality

$$(1.1) \quad \sum_{j=1}^n \binom{n+k-j}{k} \sin(jx) > 0 \quad (n, k \in \mathbf{N}; 0 < x < \pi).$$

In the same paper, Turán presented an elegant inequality for a sine sum in two variables. He demonstrated that the following companion of (1.1) is valid:

$$(1.2) \quad \sum_{j=1}^n \binom{n+k-j}{k} \frac{\sin(jx) \sin(jy)}{j} > 0 \quad (n, k \in \mathbf{N}; 0 < x, y < \pi).$$

Szegő [11] applied (1.1) with $k = 2$ to establish a theorem on univalent functions. An extension of (1.1) with $k = 2$ was given by Alzer and Kwong [3], whereas Alzer and Fuglede [1] offered a positive lower bound for the sine polynomial in (1.1) under the assumption that $n, k \geq 2$. In fact, they proved that

$$(1.3) \quad \sum_{j=1}^n \binom{n+k-j}{k} \sin(jx) > \frac{x(\pi-x)}{\pi} \quad (2 \leq n, k \in \mathbf{N}; 0 < x < \pi).$$

The definition of the sums given in (1.1) and (1.2) requires that k is a nonnegative integer. However, the identity

$$\binom{n+k-j}{k} = \binom{n+k-j}{n-j}$$

reveals that if we use the second binomial coefficient then k can be any real number. Therefore it is natural to ask for all real parameters a and b such that we have for all integers $n \geq 1$ and real numbers $x \in (0, \pi)$, $y \in (0, \pi)$:

$$(1.4) \quad S_{n,a}(x) = \sum_{j=1}^n \binom{n+a-j}{n-j} \sin(jx) > 0 \quad \text{and} \quad \Theta_{n,b}(x, y) = \sum_{j=1}^n \binom{n+b-j}{n-j} \frac{\sin(jx) \sin(jy)}{j} > 0.$$

In this paper we solve both problems. Moreover, we provide several closely related inequalities. Among others, we show that there exist functions $\lambda(x)$, $\mu(x)$ and $\lambda^*(x, y)$, $\mu^*(x, y)$ such that the estimates

$$S_{2n-1,a}(x) \geq \lambda(x) > 0, \quad S_{2n,a}(x) \geq \mu(x) > 0$$

and

$$\Theta_{2n-1,a}(x, y) \geq \lambda^*(x, y) > 0, \quad \Theta_{2n,a}(x, y) \geq \mu^*(x, y) > 0$$

are valid for all integers $n \geq 1$ and real numbers $a \geq 1$, $x \in (0, \pi)$, $y \in (0, \pi)$.

In the next section we collect some lemmas which we need to prove our main results given in Section 3. Finally, in Section 4 we apply our theorems to obtain inequalities for sums involving Chebyshev polynomials of the second kind and we also offer new integral inequalities for these polynomials. Throughout, we maintain the notations introduced in this section.

For more information on inequalities for trigonometric sums and polynomials we refer to the monograph Milovanović, Mitrinović, Rassias [9, chapter 6].

2. LEMMAS

The first lemma is due to Fejér [5].

Lemma 2.1. *Let $x \in (0, \pi)$ and*

$$(2.1) \quad \phi_n(x) = 2 \sum_{j=1}^{n-1} \sin(jx) + \sin(nx).$$

Then, $\phi_n(x) > 0$ for $n = 1, 2$ and $\phi_n(x) \geq 0$ for $n \geq 3$.

To prove (2.1) Fejér made use of the identity

$$\phi_n(x) = \sin(x) \left(n + 2 \sum_{j=1}^{n-1} \sum_{k=1}^j \cos(kx) \right)$$

which he obtained by comparing the coefficients of certain power series. Here, we offer a different proof which is more elementary than Fejér's approach.

Proof. Multiplying both sides of (2.1) by $\sin(x/2)$ gives

$$\begin{aligned} \sin(x/2)\phi_n(x) &= \sum_{j=1}^{n-1} 2 \sin(x/2) \sin(jx) + \sin(x/2) \sin(nx) \\ &= \sum_{j=1}^{n-1} (\cos((j-1/2)x) - \cos((j+1/2)x)) + \frac{1}{2} (\cos((n-1/2)x) - \cos((n+1/2)x)) \\ &= \cos(x/2) - \frac{1}{2} \cos((n-1/2)x) - \frac{1}{2} \cos((n+1/2)x) \\ &= \cos(x/2) - \cos(x/2) \cos(nx) = \cos(x/2) (1 - \cos(nx)). \end{aligned}$$

Since $x \in (0, \pi)$, we conclude that $\phi_n(x) > 0$ for $n = 1, 2$ and $\phi_n(x) \geq 0$ for $n \geq 3$. □

Next, we present an identity which will be a helpful tool not only to establish our inequalities for trigonometric sums but also to cover all cases of equality.

Lemma 2.2. *Let c_k ($k = 1, \dots, n$) be real numbers and*

$$\gamma_{k,n} = c_k + 2 \sum_{j=1}^{n-k} (-1)^j c_{j+k} \quad (k = 1, \dots, n).$$

Then,

$$(2.2) \quad \sum_{j=1}^n c_j \sin(jx) = \sum_{j=1}^n \gamma_{j,n} \phi_j(x),$$

where $\phi_j(x)$ is defined in (2.1).

Proof. We have

$$\begin{aligned} \sum_{j=1}^n \gamma_{j,n} \phi_j(x) &= \sum_{j=1}^n c_j \phi_j(x) + 2 \sum_{j=1}^n \left(\phi_j(x) \sum_{k=1}^{n-j} (-1)^k c_{k+j} \right) \\ &= \sum_{j=1}^n c_j \phi_j(x) + 2 \sum_{j=2}^n \left(c_j \sum_{k=1}^{j-1} (-1)^{j-k} \phi_k(x) \right) = c_1 \phi_1(x) + \sum_{j=2}^n c_j \left(\phi_j(x) + 2 \sum_{k=1}^{j-1} (-1)^{j-k} \phi_k(x) \right) \\ &= c_1 \sin(x) + \sum_{j=2}^n c_j \sin(jx) = \sum_{j=1}^n c_j \sin(jx). \end{aligned}$$

□

Remark 2.3. An application of Lemmas 2.1 and 2.2 leads to a result of Steinig [10], who proved that the sine polynomial in (2.2) is nonnegative on $(0, \pi)$, if $\gamma_{k,n} \geq 0$ ($k = 1, \dots, n$).

Lemma 2.4. Let a_k ($k = 1, \dots, n; n \geq 3$) be real numbers such that

$$2a_k \leq a_{k-1} + a_{k+1} \quad (k = 2, \dots, n-1) \quad \text{and} \quad 0 \leq 2a_n \leq a_{n-1}.$$

Then, for $x \in (0, \pi)$,

$$(2.3) \quad L_n(x) = \sum_{j=1}^n a_j \sin(jx) - \sum_{j=1}^{n-2} a_{j+2} \sin(jx) \geq 0.$$

Proof. Let $x \in (0, \pi)$. We define

$$\tilde{c}_j = a_j - a_{j+2} \quad (j = 1, \dots, n-2), \quad \tilde{c}_{n-1} = a_{n-1}, \quad \tilde{c}_n = a_n.$$

Then we have

$$(2.4) \quad L_n(x) = \sum_{j=1}^n \tilde{c}_j \sin(jx).$$

Let

$$\tilde{\gamma}_k = a_k - 2a_{k+1} + a_{k+2} \quad (k = 1, \dots, n-2), \quad \tilde{\gamma}_{n-1} = a_{n-1} - 2a_n, \quad \tilde{\gamma}_n = a_n.$$

By assumption,

$$(2.5) \quad \tilde{\gamma}_k \geq 0 \quad (k = 1, \dots, n).$$

We have

$$\tilde{\gamma}_k = \tilde{c}_k + 2 \sum_{j=1}^{n-k} (-1)^j \tilde{c}_{j+k} \quad (k = 1, \dots, n),$$

so that Lemma 2.2 implies

$$(2.6) \quad \sum_{j=1}^n \tilde{c}_j \sin(jx) = \sum_{j=1}^n \tilde{\gamma}_j \phi_j(x).$$

Applying Lemma 2.1 and (2.5) reveals that the sum on the right-hand side of (2.6) is nonnegative. From (2.4) and (2.6) we obtain (2.3). \square

Remark 2.5. We assume that $L_n(x_0) = 0$ with $x_0 \in (0, \pi)$. The proof of Lemma 2.4 shows that

(i) if $n \geq 3$ and $a_n > 0$, then $\phi_n(x_0) = 0$.

Moreover, since $\phi_2(x_0) > 0$, we obtain that

(ii) if $n = 3$, then $a_2 - 2a_3 = 0$;

(iii) if $n \geq 4$, then $a_2 - 2a_3 + a_4 = 0$.

The following lemma plays an important role in the proofs of Theorems 3.1 and 3.2 given in the next section.

Lemma 2.6. *For all integers $n \geq 3$ and real numbers $a \geq 1$, $x \in (0, \pi)$ we have*

$$(2.7) \quad S_{n,a}(x) \geq S_{n-2,a}(x).$$

Proof. Let $a \geq 1$. We define

$$\tilde{a}_j = \binom{n+a-j}{n-j} \quad (j = 1, \dots, n).$$

Then,

$$\tilde{a}_{j-1} - 2\tilde{a}_j + \tilde{a}_{j+1} = \frac{a(a-1)}{(n-j+1)!} \prod_{\nu=1}^{n-j-1} (n+a-j-\nu) \geq 0 \quad (j = 2, \dots, n-1),$$

$$\tilde{a}_{n-1} - 2\tilde{a}_n = a-1, \quad \tilde{a}_n = 1.$$

Since

$$S_{n,a}(x) - S_{n-2,a}(x) = \sum_{j=1}^n \tilde{a}_j \sin(jx) - \sum_{j=1}^{n-2} \tilde{a}_{j+2} \sin(jx),$$

we conclude from Lemma 2.4 that (2.7) holds for $x \in (0, \pi)$. \square

Remark 2.7. Let $n \geq 3$, $a \geq 1$, $\tilde{x}_0 \in (0, \pi)$ and $S_{n,a}(\tilde{x}_0) = S_{n-2,a}(\tilde{x}_0)$. Remark 2.5 implies that $a = 1$ and $\phi_n(\tilde{x}_0) = 0$.

3. TRIGONOMETRIC SUMS

Our first two theorems show that Turán's inequality (1.1) can be refined if we assume that either n is odd or n is even.

Theorem 3.1. *For all odd integers $n \geq 1$ and real numbers $a \geq 1$, $x \in (0, \pi)$, we have*

$$(3.1) \quad S_{n,a}(x) \geq \sin(x).$$

Equality holds if and only if $n = 1$ or $n = 3$, $a = 1$, $x = 2\pi/3$.

Proof. Let $n \geq 3$ be odd, $a \geq 1$ and $x \in (0, \pi)$. Applying Lemma 2.6 gives

$$S_{n,a}(x) \geq S_{1,a}(x) = \sin(x).$$

We discuss the cases of equality. A short calculation yields that

$$S_{3,1}(2\pi/3) = \sin(2\pi/3) = \frac{1}{2}\sqrt{3}.$$

We assume that

$$S_{n,a}(x) = \sin(x) = S_{1,a}(x).$$

Case 1. $n = 3$.

Applying Remark 2.7 leads to $a = 1$ and

$$\phi_3(x) = \sin(x)(1 + 2\cos(x))^2 = 0.$$

This gives $x = 2\pi/3$.

Case 2. $n \geq 5$.

From Lemma 2.6 we conclude that

$$S_{1,a}(x) = S_{n,a}(x) \geq S_{5,a}(x) \geq S_{3,a}(x) \geq S_{1,a}(x).$$

Thus,

$$S_{3,a}(x) = S_{1,a}(x) \quad \text{and} \quad S_{5,a}(x) = S_{3,a}(x).$$

Applying Remark 2.7 yields

$$\phi_3(x) = 0 \quad \text{and} \quad \phi_5(x) = 0.$$

The first equation yields $x = 2\pi/3$. But, $\phi_5(2\pi/3) = \sqrt{3}/2$. A contradiction. It follows that equality holds in (3.1) if and only if $n = 1$ or $n = 3$, $a = 1$, $x = 2\pi/3$. \square

Theorem 3.2. *For all even integers $n \geq 1$ and real numbers $a \geq 1$, $x \in (0, \pi)$, we have*

$$(3.2) \quad S_{n,a}(x) \geq 2\sin(x)(1 + \cos(x)).$$

Equality holds if and only if $n = 2$, $a = 1$ or $n = 4$, $a = 1$, $x = \pi/2$.

Proof. Let $a \geq 1$ and $x \in (0, \pi)$. Using (2.7) gives for even n ,

$$(3.3) \quad S_{n,a}(x) \geq S_{2,a}(x) = (1 + a)\sin(x) + \sin(2x) \geq 2\sin(x)(1 + \cos(x)).$$

We have

$$S_{2,1}(x) = 2\sin(x)(1 + \cos(x)) \quad \text{and} \quad S_{4,1}(\pi/2) = 2\sin(\pi/2)(1 + \cos(\pi/2)) = 2.$$

Next, we assume that

$$(3.4) \quad S_{n,a}(x) = 2 \sin(x)(1 + \cos(x)).$$

Case 1. $n = 2$.

We obtain

$$0 = S_{2,a}(x) - 2 \sin(x)(1 + \cos(x)) = (a - 1) \sin(x).$$

Thus, $a = 1$.

Case 2. $n = 4$.

Applying (3.3) and (3.4) yields

$$S_{4,a}(x) = S_{2,1}(x).$$

It follows from Remark 2.7 that $a = 1$ and

$$\phi_4(x) = 8 \sin(x)(1 + \cos(x)) \cos^2(x) = 0.$$

Thus, $x = \pi/2$.

Case 3. $n \geq 6$.

From (2.7), (3.3) and (3.4) we conclude that

$$S_{4,a}(x) = S_{2,a}(x) \quad \text{and} \quad S_{6,a}(x) = S_{4,a}(x),$$

so that Remark 2.7 gives

$$\phi_4(x) = 0 \quad \text{and} \quad \phi_6(x) = 0.$$

The first equation yields $x = \pi/2$, but $\phi_6(\pi/2) = 2$. Hence, equality holds in (3.2) if and only if $n = 2$, $a = 1$ or $n = 4$, $a = 1$, $x = \pi/2$. \square

Remark 3.3. From Theorems 3.1 and 3.2 we conclude that the estimate

$$(3.5) \quad S_{n,a}(x) > \sin(x) \min\{1, 2(1 + \cos(x))\}$$

is valid for $n \geq 1$, $a \geq 1$ and $x \in (0, \pi)$. The lower bounds given in (1.3) and (3.5) cannot be compared. Indeed, the function

$$x \mapsto \frac{x(\pi - x)}{\pi} - \sin(x) \min\{1, 2(1 + \cos(x))\}$$

is negative on $(0, x_1)$ and positive on (x_1, π) , where $x_1 = 2.204\dots$

The following extension of inequality (1.1) is valid.

Theorem 3.4. *Let a be a real number. The inequality*

$$(3.6) \quad S_{n,a}(x) > 0$$

holds for all integers $n \geq 1$ and real numbers $x \in (0, \pi)$ if and only if $a \geq 1$.

Proof. From (3.5) we conclude that if $a \geq 1$, then (3.6) holds for all $n \geq 1$ and $x \in (0, \pi)$. Conversely, let (3.6) be valid for all $n \geq 1$ and $x \in (0, \pi)$. Since $S_{2,a}(\pi) = 0$, we obtain

$$\left. \frac{d}{dx} S_{2,a}(x) \right|_{x=\pi} = 1 - a \leq 0.$$

Thus, $a \geq 1$. \square

Next, we present inequalities for the sine polynomial

$$S_{n,a}^*(x) = \sum_{\substack{j=1 \\ j \text{ odd}}}^n \binom{n+a-j}{n-j} \sin(jx).$$

Applications of Theorems 3.1 and 3.2 lead to counterparts of (3.1) and (3.2).

Theorem 3.5. *For all odd integers $n \geq 1$ and real numbers $a \geq 1$, $x \in (0, \pi)$, we have*

$$(3.7) \quad S_{n,a}^*(x) \geq \sin(x).$$

Equality holds if and only if $n = 1$.

Proof. Let $n \geq 1$ be odd and $a \geq 1$, $x \in (0, \pi)$. Inequality (3.1) leads to

$$2S_{n,a}^*(x) = S_{n,a}(x) + S_{n,a}(\pi - x) \geq \sin(x) + \sin(\pi - x) = 2\sin(x).$$

If equality holds in (3.7), then

$$S_{n,a}(x) = \sin(x) \quad \text{and} \quad S_{n,a}(\pi - x) = \sin(\pi - x).$$

From Theorem 3.1 we conclude that $n = 1$. □

Theorem 3.6. *For all even integers $n \geq 2$ and real numbers $a \geq 1$, $x \in (0, \pi)$, we have*

$$(3.8) \quad S_{n,a}^*(x) \geq 2\sin(x).$$

Equality holds if and only if $n = 2$, $a = 1$ or $n = 4$, $a = 1$, $x = \pi/2$.

Proof. Let $n \geq 2$ be even and $a \geq 1$, $x \in (0, \pi)$. We apply (3.2) and obtain

$$2S_{n,a}^*(x) = S_{n,a}(x) + S_{n,a}(\pi - x) \geq 2\sin(x)(1 + \cos(x)) + 2\sin(\pi - x)(1 + \cos(\pi - x)) = 4\sin(x).$$

If $n = 2$, $a = 1$ or $n = 4$, $a = 1$, $x = \pi/2$, then equality is valid in (3.8). Conversely, if equality holds in (3.8), then

$$S_{n,a}(x) = 2\sin(x)(1 + \cos(x)) \quad \text{and} \quad S_{n,a}(\pi - x) = 2\sin(\pi - x)(1 + \cos(\pi - x)).$$

Applying Theorem 3.2 leads to $n = 2$, $a = 1$ or $n = 4$, $a = 1$, $x = \pi/2$. □

Now, we study the sine sum in two variables given in (1.4). The following two theorems offer improvements of inequality (1.2).

Theorem 3.7. *For all odd integers $n \geq 1$ and real numbers $a \geq 1$, $x, y \in (0, \pi)$, we have*

$$(3.9) \quad \Theta_{n,a}(x, y) \geq \sin(x) \sin(y).$$

Equality holds if and only if $n = 1$.

Proof. Let $n \geq 1$ be odd and $a \geq 1$. Since equality holds in (3.9) if $n = 1$, we suppose that $n \geq 3$. Applying Theorem 3.1 gives for $x, y \in \mathbf{R}$ with $0 < x - y < \pi$ and $0 < x + y < \pi$:

$$S_{n,a}(x - y) + S_{n,a}(x + y) \geq \sin(x - y) + \sin(x + y).$$

This leads to

$$(3.10) \quad \sum_{j=1}^n \binom{n+a-j}{n-j} \sin(jx) \cos(jy) \geq \sin(x) \cos(y).$$

Equality holds in (3.10) if and only if $n = 3$, $a = 1$ and $x - y = 2\pi/3$, $x + y = 2\pi/3$, that is, $x = 2\pi/3$, $y = 0$. To obtain (3.9) we integrate both sides of (3.10) with respect to y .

Let $x_0, y_0 \in \mathbf{R}$ with $0 < y_0 \leq x_0 < \pi$. We consider two cases.

Case 1. $x_0 \leq \pi/2$.

Let $0 < y < y_0$. Then, $0 < x_0 - y < x_0 + y < \pi$. It follows from (3.10) with “ $>$ ” instead of “ \geq ” that

$$(3.11) \quad \int_0^{y_0} \sum_{j=1}^n \binom{n+a-j}{n-j} \sin(jx_0) \cos(jy) dy > \int_0^{y_0} \sin(x_0) \cos(y) dy.$$

This leads to (3.9) with $x = x_0$, $y = y_0$ and “ $>$ ” instead of “ \geq ”.

Case 2. $\pi/2 < x_0$.

Case 2.1. $y_0 \leq \pi - x_0$.

Let $0 < y < y_0$. Then, $0 < x_0 - y < x_0 + y < \pi$, so that we obtain (3.11) and (3.9) with $x = x_0$, $y = y_0$ and “ $>$ ” instead of “ \geq ”.

Case 2.2. $\pi - x_0 < y_0$.

We set $x_1 = \pi - x_0$ and $y_1 = \pi - y_0$. Let $0 < y < x_1$. Then, $0 < y_1 - y < y_1 + y < \pi$. This leads to (3.11) with x_1 instead of y_0 and y_1 instead of x_0 . Using

$$\sin(jy_1) = (-1)^{j-1} \sin(jy_0) \quad \text{and} \quad \sin(jx_1) = (-1)^{j-1} \sin(jx_0) \quad (j \in \mathbf{N}),$$

we obtain (3.9) with $x = x_0$, $y = y_0$ and “ $>$ ” instead of “ \geq ”. \square

Theorem 3.8. *For all even integers $n \geq 2$ and real numbers $a \geq 1$, $x, y \in (0, \pi)$, we have*

$$(3.12) \quad \Theta_{n,a}(x, y) \geq 2 \sin(x) \sin(y) (1 + \cos(x) \cos(y)).$$

Equality holds if and only if $n = 2$, $a = 1$.

Proof. The proof is similar to that of Theorem 3.7. Therefore, we only offer a proof sketch. Since

$$\Theta_{2,a}(x, y) = 2 \sin(x) \sin(y) \left(\frac{a+1}{2} + \cos(x) \cos(y) \right),$$

we conclude that if $n = 2$, then (3.12) is valid with equality if and only if $a = 1$. Let $n \geq 4$. Using Theorem 3.2 we obtain for $x, y \in \mathbf{R}$ with $0 < x - y < \pi$ and $0 < x + y < \pi$:

$$(3.13) \quad \sum_{j=1}^n \binom{n+a-j}{n-j} \sin(jx) \cos(jy) \geq 2 \sin(x) \cos(y) + \sin(2x) \cos(2y).$$

Equality holds in (3.13) if and only if $n = 4$, $a = 1$, $x = \pi/2$, $y = 0$.

Let $x_0, y_0 \in \mathbf{R}$ with $0 < y_0 \leq x_0 < \pi$. We assume that $x_0 \leq \pi/2$. If $0 < y < y_0$, then $0 < x_0 - y < x_0 - y_0 < \pi$. Next, we integrate both sides of (3.13) (with $x = x_0$ and “ $>$ ” instead of “ $>$ ”) from $y = 0$ to $y = y_0$. This gives

$$(3.14) \quad \Theta_{n,a}(x_0, y_0) > 2 \sin(x_0) \sin(y_0) (1 + \cos(x_0) \cos(y_0)).$$

By similar arguments we conclude that (3.14) also holds if $x_0 > \pi/2$. \square

Let

$$\Theta_{n,a}^*(x, y) = \sum_{\substack{j=1 \\ j \text{ odd}}}^n \binom{n+a-j}{n-j} \frac{\sin(jx) \sin(jy)}{j}.$$

Applying Theorems 3.7 and 3.8 we obtain the following companions of (3.7) and (3.8).

Theorem 3.9. *For all real numbers $a \geq 1$ and $x, y \in (0, \pi)$ we have*

$$(3.15) \quad \Theta_{n,a}^*(x, y) \geq \sin(x) \sin(y), \quad \text{if } n \text{ is odd}$$

and

$$(3.16) \quad \Theta_{n,a}^*(x, y) \geq 2 \sin(x) \sin(y), \quad \text{if } n \text{ is even.}$$

Equality holds in (3.15) if and only if $n = 1$ and in (3.16) if and only if $n = 2, a = 1$.

The proof of this theorem is quite similar to the proofs of Theorems 3.5 and 3.6, so that we omit the details. We conclude this section with a generalization of inequality (1.2).

Theorem 3.10. *Let a be a real number. The inequality*

$$(3.17) \quad \Theta_{n,a}(x, y) > 0$$

holds for all integers $n \geq 1$ and real numbers $x, y \in (0, \pi)$ if and only if $a \geq 1$.

Proof. Let $a \geq 1$. From Theorem 3.7 and 3.8 we conclude that $\Theta_{n,a}(x, y)$ is positive for all $n \geq 1$ and $x, y \in (0, \pi)$. Conversely, if (3.17) holds for all $n \geq 1$ and $x, y \in (0, \pi)$, then we have

$$\Theta_{2,a}(0, y) = 0 \quad \text{and} \quad \frac{\partial}{\partial x} \Theta_{2,a}(x, y) \Big|_{x=0} = \sin(y)(1 + a + 2 \cos(y)) \geq 0.$$

It follows that

$$1 + a + 2 \cos(y) \geq 0.$$

We let $y \rightarrow \pi$ and obtain $a - 1 \geq 0$. \square

4. CHEBYSHEV POLYNOMIALS

The Chebyshev polynomials of the first and second kind, $T_n(x)$ and $U_n(x)$ ($n = 0, 1, 2, \dots$), are polynomials in x of degree n defined by

$$(4.1) \quad T_n(x) = \cos(nt) \quad \text{and} \quad U_n(x) = \frac{\sin((n+1)t)}{\sin(t)}, \quad x = \cos(t), \quad t \in [0, \pi].$$

They have remarkable applications in numerical analysis, approximation theory and other branches of mathematics. The main properties of these functions can be found, for instance, in Mason and Handscomb [8].

Using the notation (4.1) we obtain from (1.1) the inequality

$$(4.2) \quad \Lambda_{n,k}(x) = \sum_{j=0}^n \binom{n+k-j}{n-j} U_j(x) > 0 \quad (0 \leq n \in \mathbf{Z}, k \in \mathbf{N}; -1 < x < 1).$$

The results presented in Section 3 lead to inequalities for Chebyshev polynomials of the second kind. As examples we offer counterparts of Theorems 3.1 and 3.2 which provide refinements of (4.2).

Theorem 4.1. *For all even integers $n \geq 0$ and real numbers $a \geq 1$, $x \in (-1, 1)$, we have*

$$\Lambda_{n,a}(x) \geq 1.$$

Equality holds if and only if $n = 0$ or $n = 2$, $a = 1$, $x = -1/2$.

Theorem 4.2. *For all odd integers $n \geq 1$ and real numbers $a \geq 1$, $x \in (-1, 1)$, we have*

$$\Lambda_{n,a}(x) \geq 2(1+x).$$

Equality holds if and only if $n = 1$, $a = 1$ or $n = 3$, $a = 1$, $x = 0$.

The inequalities

$$(4.3) \quad 0 < \sum_{j=1}^n \frac{\sin(jx)}{j} < \pi - x \quad (n \in \mathbf{N}; 0 < x < \pi)$$

are classical results in the theory of trigonometric polynomials. In 1910, Fejér conjectured the validity of the left-hand side. The first proofs were published by Jackson [7] in 1911 and Gronwall [6] in 1912. The right-hand side is due to Turán [13], who proved his inequality in 1938. The following interesting companion of (4.3) was given by Carslaw [4] in 1917:

$$(4.4) \quad 0 < \sum_{j=0}^n \frac{\sin((2j+1)x)}{2j+1} \leq 1 \quad (0 \leq n \in \mathbf{Z}, 0 < x < \pi).$$

Equality holds if and only if $n = 0$, $x = \pi/2$. See also [2]. We show that applications of (4.3) and (4.4) lead to integral inequalities for the Chebyshev polynomials.

Theorem 4.3. *For all integers $n \geq 1$ and real numbers $x \in (0, 1)$, we have*

$$(4.5) \quad \arccos(x) < \int_x^1 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt < \pi - \arccos(x).$$

If $x \in (-1, 0)$, then (4.5) holds with “ $>$ ” instead of “ $<$ ”.

Proof. Let $t \in (0, \pi)$ and

$$F_n(t) = \sum_{j=1}^n \frac{\sin(2jt)}{j}.$$

Then,

$$F'_n(t) = 2 \sum_{j=1}^n \cos(2jt) = \frac{\sin((2n+1)t)}{\sin(t)} - 1 = U_{2n}(\cos(t)) - 1.$$

This gives for $z \in (0, \pi)$:

$$F_n(z) = \int_0^z F'_n(t) dt = \int_0^z U_{2n}(\cos(t)) dt - z = \int_{\cos(z)}^1 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt - z.$$

If $x \in (0, 1)$, then $\arccos(x) \in (0, \pi/2)$. Using (4.3) leads to

$$0 < F_n(\arccos(x)) = \int_x^1 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt - \arccos(x) < \pi - 2 \arccos(x).$$

This implies (4.5).

We define for $x \in (-1, 1)$:

$$G_n(x) = \arccos(x) - \int_x^1 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt \quad \text{and} \quad w(x) = \arccos(x) - \frac{\pi}{2}.$$

Applying

$$(4.6) \quad w(x) + w(-x) = 0$$

and

$$\int_0^1 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt = \frac{\pi}{2}$$

yields

$$G_n(x) + G_n(-x) = \left(2 \int_0^1 - \int_x^1 - \int_{-x}^1 \right) \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt = \left(\int_0^x - \int_{-x}^0 \right) \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt.$$

Since U_{2n} is an even function, we obtain

$$\int_0^x \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt = \int_0^x \frac{U_{2n}(-t)}{\sqrt{1-t^2}} dt = \int_{-x}^0 \frac{U_{2n}(t)}{\sqrt{1-t^2}} dt.$$

Thus,

$$(4.7) \quad G_n(x) + G_n(-x) = 0.$$

Using (4.6) and (4.7) gives that the function

$$H_n(x) = G_n(x) - 2w(x)$$

satisfies

$$(4.8) \quad H_n(x) + H_n(-x) = 0.$$

From (4.5), (4.7) and (4.8) we conclude that for $x \in (-1, 0)$ we have

$$-G_n(x) = G_n(-x) < 0 < H_n(-x) = -H_n(x).$$

This leads to (4.5) with “ $>$ ” instead of “ $<$ ”.

□

Remark 4.4. The functions

$$x \mapsto \int_x^1 \frac{U_n(t)}{\sqrt{1-t^2}} dt - \arccos(x) \quad (n = 3, 7, 11)$$

and

$$x \mapsto \pi - \arccos(x) - \int_x^1 \frac{U_n(t)}{\sqrt{1-t^2}} dt \quad (n = 1, 5, 9)$$

attain positive and negative values on $(0, 1)$. This implies that Theorem 4.3 is in general not true for Chebyshev polynomials of odd degree.

We conclude this paper with a theorem which offers sharp upper and lower bounds for an integral involving the Chebyshev polynomials of the first and second kind.

Theorem 4.5. *For all integers $n \geq 0$ and real numbers $x \in (-1, 1)$ we have*

$$(4.9) \quad 0 < \int_x^1 \frac{T_{n+1}(t) U_n(t)}{\sqrt{1-t^2}} dt \leq 1.$$

Equality holds on the right-hand side if and only if $n = 0$, $x = 0$.

Proof. Let $x \in (-1, 1)$. Since $T_1(t) = t$ and $U_0(t) = 1$, we obtain

$$\int_x^1 \frac{T_1(t) U_0(t)}{\sqrt{1-t^2}} dt = \sqrt{1-x^2}.$$

This leads to (4.9) with $n = 0$.

Let $n \geq 1$. We denote the sine sum in (4.4) by $I_n(x)$. Then, for $t \in (0, \pi)$,

$$I'_n(t) = \sum_{j=0}^n \cos((2j+1)t) = \frac{\cos((n+1)t) \sin((n+1)t)}{\sin(t)} = T_{n+1}(\cos(t)) U_n(\cos(t)).$$

Hence, we get for $z \in (0, \pi)$:

$$I_n(z) = \int_0^z I'_n(t) dt = \int_{\cos(z)}^1 \frac{T_{n+1}(t) U_n(t)}{\sqrt{1-t^2}} dt,$$

so that (4.4) (with “ $<$ ” instead of “ \leq ”) gives

$$0 < I_n(\arccos(x)) = \int_x^1 \frac{T_{n+1}(t) U_n(t)}{\sqrt{1-t^2}} dt < 1.$$

This completes the proof. □
